

PVC piping system

If the back wall consists of cocos panels cork panelling or tree fern root panels, it is possible to mount a spraying tube behind the panels.

This tube is attached to a pump which pumps up the water. A valve distributes the water between dripping through the back wall as well as falling down as waterfall along oak wood.

The plants receive water and the humidity will automatically increase. Vivaria supply all parts for this system; spraying tubes, taps for a waterfall and pumps with different pumping heights.
